Classical and Quantum Models and Arithmetic Problems

Here is an unsurpassed resource-important accounts of a variety of dynamic systems topics related to number theory. Twelve distinguished mathematicians present a rare complete analytic solution of a geodesic quantum problem on a negatively curved surface and explicit determination of modular function growth near a real point applications of number theory to dynamical systems and applications of mathematical physics to number theory. tributes to the often-unheralded pioneers in the field. an examination of completely integrable and exactly solvable physical models. and much more! Classical and Quantum Models and Arithmetic Problems is certainly a major source of information, advancing the studies of number theorists, algebraists, and mathematical physicists interested in complex mathematical properties of quantum field theory, statistical mechanics, and dynamic systems. Moreover, the volume is a superior source of supplementary reading for graduate-level courses in dynamic systems and application of number theory.
