Computers and Aphasia

A Special Issue of Aphasiology

This special issue of Aphasiology brings together papers from six countries in three continents on the ways in which computers are being used in the domain. Information technology is now well established as a means of delivering treatment to people with aphasia and this issue includes papers which describe the latest ways in which this is being carried out. Doesborgh et. al. report on Multicue, a way in which the capabilities of computers are used to support cueing approaches to the treatment of naming difficulties; and Mortley et. al. use the internet as a means of delivering innovative treatment approaches to the client at home. It is important that the high tech glamour of the technology does not obscure the need to critically evaluate the contribution of this mode of treatment. Two papers, Wallesch & Johanssen-Horbach, and Wertz & Katz, review and critique the outcomes and effectiveness of computer mediated therapy. In the 21st century computers are increasingly a part of everyday life and two papers address ways in which people with aphasia may benefit from this and engage in the emerging "information society", Van de Sandt-Koenderman looks at ways in which the technology can be used to support communication in day to day life by the provision of appropriate communication aids. Egan et. al. report on training people with aphasia to access the internet on their own account so that they may fully engage with this resource as active citizens.
